# Get to Know AtoM's Codebase

An introduction for developers and systems administrators covering Symfony, developer resources, standard practices, and other information.

apps/qubit	Change FW treeview node format, refs #10909	7 days ago
cache	Stop using .gitignore under certain directories.	5 years ago
config	Add status id to term foreign key to schema.	13 days ago
css	Merge IO browse and adv. search pages, refs #9141	a year ago
data	version bump.	15 days ago
images	Add full width treeview, refs #6375	2 years ago
init	Add reference systemd worker service, refs #9623	a year ago
js	Improve alerts after FW treeview, refs #10973	29 days ago
lib	Taxonomy normalize fix, refs #10974	8 days ago
log	Empty .sf file	5 years ago
plugins	Fixed failing of MODS import, refs #10975	22 days ago
test	renderDate leading zeroes on day, Refs #10641	4 months ago

# AtoM

## Technology overview

AtoM is Symfony 1 based - [symfony.com/legacy](https://symfony.com/legacy)

- ORM - Propel
- MVC framework

PHP > 5.5, MySql, Nginx (Apache)

Elasticsearch 1.7.5 - (5.2 soon!)

Bootstrap 2.3.2, Less CSS

Javascript - JQuery 1.8.3

Other dependencies:

<https://www.accesstomemory.org/docs/latest/admin-manual/installation/requirements/#installation-requirements>

---

# Debug Mode and AtoM Logs

Use to determine:

- Contents of request
- Contents of response
- Route being requested
- User context details
- AtoM application settings
- Plus more!

Turn on debug mode:

1. `cd` to atom root dir
2. Edit `qubit_dev.php` to add your ip to array: `$allowedIps`
3. In atom dir: `php symfony cc`
4. Update URL to: `http://10.10.10.10/qubit_dev.php`
5. Browse AtoM as you normally would, 'qubit\_dev' will 'stick'
6. **sf** icon in top right
7. Logs in atom/log: `qubit_dev.log`

# Tour of AtoM Codebase

- Modules: Controllers & Views
- Models
- Plugins (themes + more)
- Background jobs
- Migrations
- Vendor
- Javascript

# Tour of AtoM Codebase

## Modules: Controllers and Views

Modules found in: `atom/apps/qubit/modules`

- Each folder here is a module
- Controllers in 'actions' (`xAction.class.php`)
  - Form **extends** **DefaultEditAction**
  - Handles both **HTTP GET and POST**
    - See `$request->isMethod()`
- Views located in 'templates' (`xSuccess.class.php`)

Example: `modules/object/actions` import and export

Base templates and layouts:

`atom/apps/qubit/templates`

# Tour of AtoM Codebase

## Models

Class definitions for objects representing db table rows

E.g. Actors, Information Objects (Archival Descr), Repositories

- Located in: `atom/lib/model`
  - Inherit from abstract base classes (abc)
- abc's located in: `atom/lib/model/om`
  - Almost all major objects extend QubitObject
    - Id's are unique; from a common pool
    - Base methods are defined once
    - Classes can override base methods if necessary

General non-ORM classes located in `atom/lib`

E.g. Parsers, Import and Export classes, Clipboard etc.

Helper functions

- `atom/lib/helper/QubitHelper.php`
- `atom/lib/Qubit.class.php`

# Tour of AtoM Codebase

## Plugins

Located in `atom/plugins`

Plugins come in various types:

- Theme (more detail later!)
  - Dominion and Archives Canada
  - Plugin configuration file: summary must include 'theme'
- Functional
  - ElasticSearch, Install, RestAPI
  - Most of these loaded automatically - `ProjectConfiguration.class.php`
- Templating
  - ISAD, ISAAR, ISDIAH, MODS, EAD etc.
  - AtoM disallows deactivation of ISAD, ISAAR, ISDIAH
    - ISAAR & ISDIAH have no alternative templates
    - ISAD plugin is an exception - is extended by DACS

Structure of plugin folder mirrors the AtoM folder

- Used to add models - e.g. ElasticSearch plugin
- Used to override existing module functionality - e.g. AC Theme
- Used to add new controllers - e.g. Rest API

[Community contributed plugins](#)

---

# Tour of AtoM Codebase

## Background Jobs

Located in `atom/lib/job`

Used to make long running processes run asynchronously

- Prevents http timeouts
- Avoids making user wait for action to complete

### Initiating a background job

- Place in queue - use `QubitJob::runJob`
  - E.g. object export controller
  - creates and returns a `QubitJob`
  - `runJob` signals gearman that job is available

### Background job launched by gearmand

- Execute in background on server
- Use `QubitJob` record to communicate completion
- Job classes all extend `arBaseJob`
- Monitor progress on Manage Jobs page (viewing `QubitJobs`)

---

# Tour of AtoM Codebase

## Migrations

### Located in

`atom/lib/task/migrate/migrations`

Migrations modify the database in some fashion

- Used to update existing installations
- New data fixture (setting, menu item etc)
  - E.g. Migration 148, 149
- Database change
  - E.g. Migration 134

Database is versioned - can be viewed on Settings page

- Note 'Version' const in each migration file

Migrations triggered by CLI task

- `php symfony tools:upgrade-sql`

New installations

- Would not use migrations
- Load fixtures from yml files when database is populated

---

# Tour of AtoM Codebase

## Vendor

Located in `atom/vendor`

Contains 3rd party plugins & dependencies

Be aware of license! AtoM is AGPL-v3.

Licenses of all vendor contents

- Must be compatible with AGPL-v3
- Will be listed in AtoM's COPYRIGHT file

Typically code changes to files in here are avoided

Plugins can also include vendor items

---

# Tour of AtoM Codebase

## Javascript

**Located in** `atom/js`

We have some js to handle client & WebUI behaviours

Uses JQuery

E.g. See module object export

```
$this->response->addJavaScript('exportOptions', 'last');
```

---

# Tour of AtoM Codebase

## CLI Tasks

Run from root dir of AtoM

AtoM provides variety of CLI administrative tasks

- Usage: `php symfony [options] task_name [arguments]`

User and File permissions important

Some commands can be destructive!

- E.g. `tools:purge`

Help for each task is provided

- E.g. `php symfony help tools:add-superuser`
